

Bitcoin Mining

What is Bitcoin Mining?

- Proof of Work = solving puzzles with energy
- Hardware: from CPUs → GPUs → ASICs
- Hash rate = “mining power of the network”

Energy

- Bitcoin = protocol bounded by energy
- Miners convert electricity to secure the network
- More energy - more security

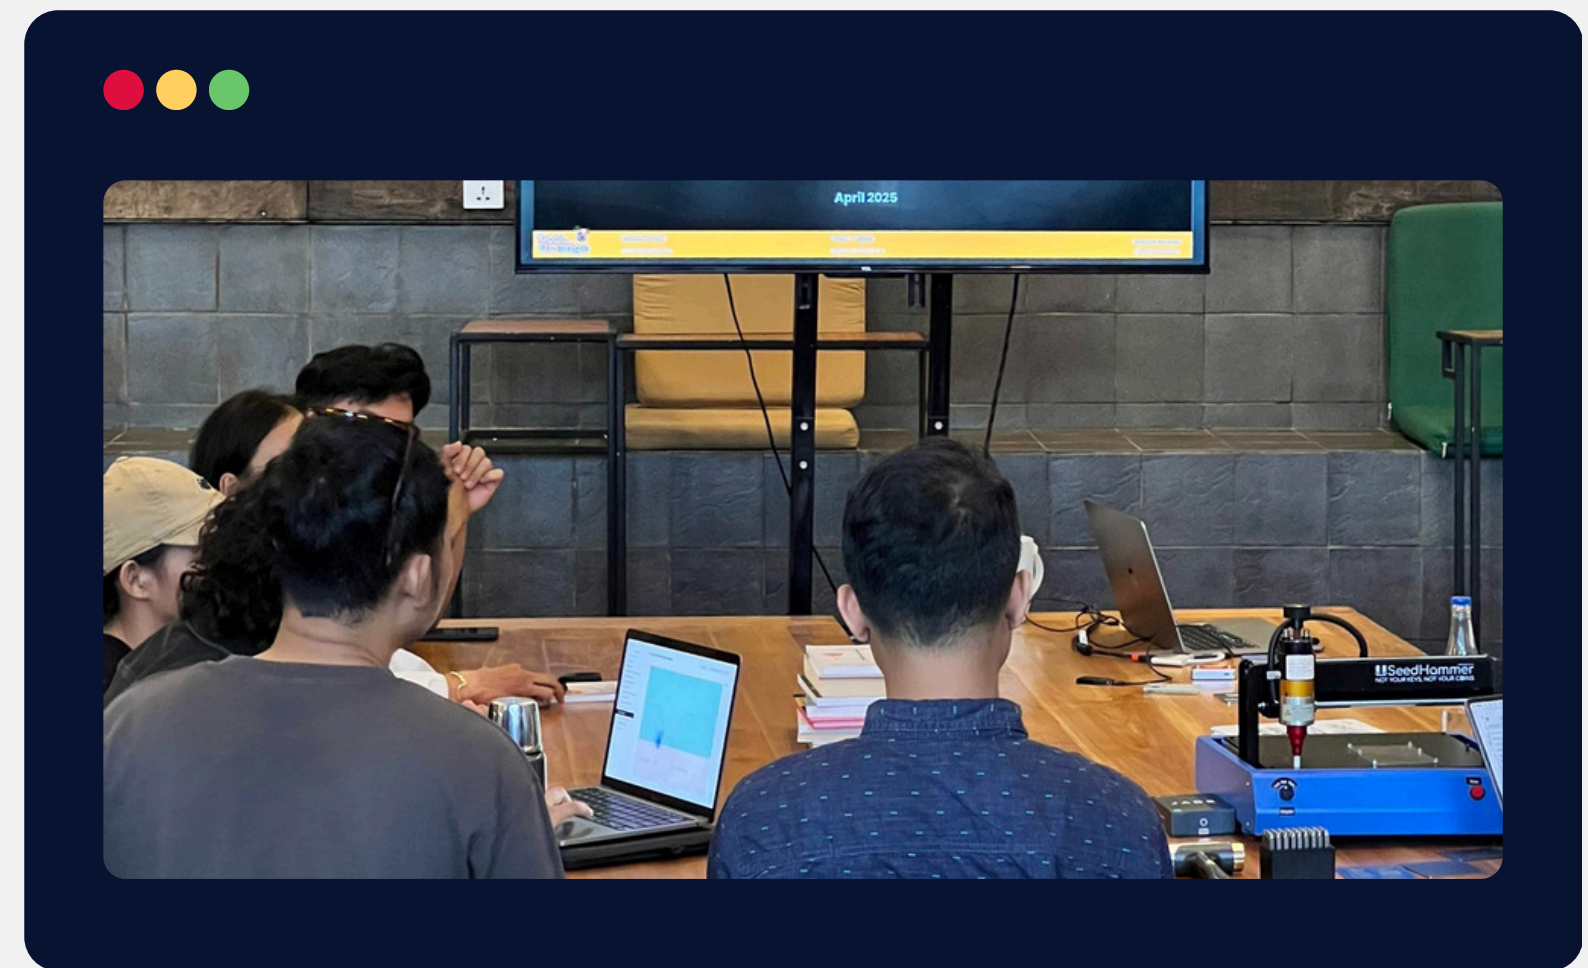

“If you had an energy-backed protocol, **decentralized and secure**... prices would fall forever”

-Jeff Booth

- Block reward + transaction fees
- Halving = supply cut every 4 years
- Profit = Bitcoin price - energy cost

Mining Economics

Environmental Debate

- Critics: “wasteful energy use”
- Bitcoiners: “seeks cheapest, cleanest energy”
- Opportunity: renewables & stranded energy

Indonesia's Hydro Potential

- Rich in rivers & hydropower
- Mining incentivizes renewable energy buildout
- Miners = flexible load
- Can stabilize grids
- Turn “excess hydro” into money (bitcoin)

Questions for the room

- Can mining fund renewable expansion?
- How to align Bitcoin with local energy policy?
- What steps can we take to start mining in Indonesia?

Thank you
